Extended language support for WRT

What is it

This article describes an extended way for getting the supported languages on a WRT supported device

Why

The current method only returns S60 enumerations and they cannot be used easily in code.

```
function getLangExtended() {
//This function returns the ISO codes, S60 enumerations and real names
//for all languages supported by the device.
//Requires S60 Platform services
//Covers also all languages not yet supported ;o)

    var systemServiceObj = null;
     systemServiceObj = device.getServiceObject("Service.SysInfo", "ISysInfo");

 var criteria = new Object();
  criteria.Entity = "General";
  criteria.Key = "SupportedLanguages";
 alert(criteria.Key);

 var result = systemServiceObj.ISysInfo.GetInfo(criteria callBack);
 var langList=result.ReturnValue.LanguageList;

  criteria.Entity = "General";
  criteria.Key = "InputLanguage";
 alert(criteria.Key);

 var result = systemServiceObj.ISysInfo.GetInfo(criteria callBack);
 var defaultLang = result.ReturnValue.Status;

 var languages = new Array();

 for (var i=0;i<=langList.length-1;i++){
  var language = new Object();
  var fromTable = langCodeTable[langList[i]].split("|");
  language.s60Enum = langList[i];
  language.ISOCode = fromTable[0];
  language.realName = fromTable[1];
  language.eLang = fromTable[2];
  if(languages.s60Enum == defaultLang){
   language.default = true;
  }else{
   language.default = false;
  }
  languages[i] = language;
 }
 return languages;
}
var langCodeTable = new Array(); //Array to store the language values
langCodeTable[0]="dummy|No WRT|Am I on PC";//Dummy value for testing in browser
