Record update with RecordStore.setRecord() fails in Series 40 (Known Issue)

Description

`RecordStore.setRecord()` fails to reuse the existing reserved memory, resulting in 'Out of Memory exception' application error notification or the program exiting directly without any notification at all.

How to reproduce

1. Implement a test MIDlet using the following code:

```
import javax.microedition.midlet.*;
import javax.microedition.rms.RecordStore;
import javax.microedition.lcdui.*;

public class ErrorDemo extends MIDlet {

//.. pauseApp() and destroyApp() excluded for code brevity

 protected void startApp() throws MIDletStateChangeException {

 boolean newrun = false;
 Form f = new Form("Debug");
 Display.getDisplay( this ).setCurrent( f );

 try {

  f.append("Starting...");

  RecordStore r = RecordStore.openRecordStore( "dummy" , true );

  int cntr, cntr2;
  byte[] empty = new byte[512];

   if( r.getNextRecordID() < 2 ) { // empty RMS?

   newrun = true;
   cntr = 1;

   while( r.getSizeAvailable() > 1024 ) {

     r.addRecord(empty, 0, 512); // Fill the RMS

     cntr++;

  }

 } else cntr = r.getNextRecordID() - 1;

 f.append( "Replacing those records" );

 StringItem i = new StringItem( "Record No", "" );

 f.append( i );

 // Replacing all of the records

 for( cntr2=1; cntr2<cntr; cntr2++ ) {

  i.setText( String.valueOf( cntr2 ) );

  if( !newrun ) Thread.sleep(1000);

  r.setRecord(cntr2, empty, 0, 512);

 }
} catch( Exception e ) {}

f.append("Done"); // Record (re)placing finished.

try { Thread.sleep(5000); } // Waiting for a while before exiting the MIDlet.

catch( Exception e ){}

notifyDestroyed();

 }
}
```

2. Launch the MIDlet, let it write the records, and exit the MIDlet.
3. Launch the MIDlet again. The described issue occurs.
